Flask: Optional Content

Congratulations! You have created a simple website with Flask, one of the most popular Python web frameworks.

Bear in mind, the content we taught you is far too enough to support your project. You should learn to solve your problems.

When you come across problems, you can always ask the search engines with keywords "flask + your problem". You can also refer to the official documents of Flask and other components we referred. Typically there is more than one choice of modules for many common functions like login. You can always try some new approach to solve your problem but not be restricted by what the material introduced.

Finally, you can try the following optional task if you want.

Optional Task

Task 6.1: You may notice that the `admin()` function is empty except rendering the page. You can try to finish this page by your self.

The page allows a user to add, update, delete events on any given date. The user should input a date in the date field on the upper side, then click the query date button. All events on this date will be displayed on the text area below (one event one line). The user can directly modify the events in this text area, and click the submit button to save.
